## EXPERIENCE

### ASAP, San Francisco— *Software Engineer*

DECEMBER 2014 - DECEMBER 2016

- Led design and development of the Insights reporting product.
- Fixed critical issues at all levels of the stack.
- Improved performance and data integrity of the system by refactoring problematic legacy code and database designs.
- Designed and developed new features and bug fixes.

### ASAP, San Francisco— *Support Engineer*

JUNE 2014 - DECEMBER 2014

- Solved more than twice the number of support tickets than the next highest performer within my first two weeks, and maintained this performance throughout my time in Support.
- Streamlined engineering workflow.
- Identified database management as an internal bottleneck and taught myself T-SQL and SQL Server to solve data-related support issues, and to query our databases to identify problems and write specs for their fixes before clients report them.
- Built tools with T-SQL to solve our most common data issues.

## NOTABLE PROJECT

### Time Is Money — *Google Chrome Extension*

My first Javascript project: A Google Chrome extension I whipped together one weekend that converts prices online into your equivalent work hours. It got some coverage from Lifehacker, Fast Company, and Yahoo News, and now boasts tens of thousands of active users.

## PROJECTS

**Judicious** is a debate platform built with Meteor.js.

**Wikirace** is an implementation of The Wikipedia Game built with Meteor.js.

**Farm Plus** was a sustainable food production experiment. My team and I built and tested half a dozen different business models and prototypes, and spent thousands of hours interviewing hundreds of potential customers, partners, and competitors.

## TECHNOLOGIES

HTML, CSS, JavaScript

Python, Tensorflow

Meteor.js, Node.js, MongoDB

C#, T-SQL, SQL Server

Git, SVN, JIRA, Zendesk

## CERTIFICATIONS

**The Data Scientist's Toolbox** verified from Coursera 2014.

**R Programming** verified from Coursera 2014.

**Getting and Cleaning Data** verified from Coursera 2016.
